

# What You Don't Know Really Can Hurt You.

**Prism Asset Manager®** Discover everything you need to know about your computing environment to make the right decisions — automatically.

## Features in Prism Asset Manager® include:

■ **Internet-based Administration** – Prism Asset Manager makes managing your mobile workforce and widely distributed environments easy, and enables secure administration from any remote location with an Internet connection.

■ **Software Discovery** – Prism Asset Manager identifies all software installed across your network using a software knowledge base that recognizes more than 10,000 commercial software applications and their component files. You can add to this knowledge base with information about your own custom applications.

■ **Hardware Discovery** – Prism Asset Manager automatically identifies managed computers and their hardware configurations. Computers can be easily grouped based on configuration characteristics defined by the administrator. Inventory scans can be scheduled to occur automatically or performed on-demand at any time.

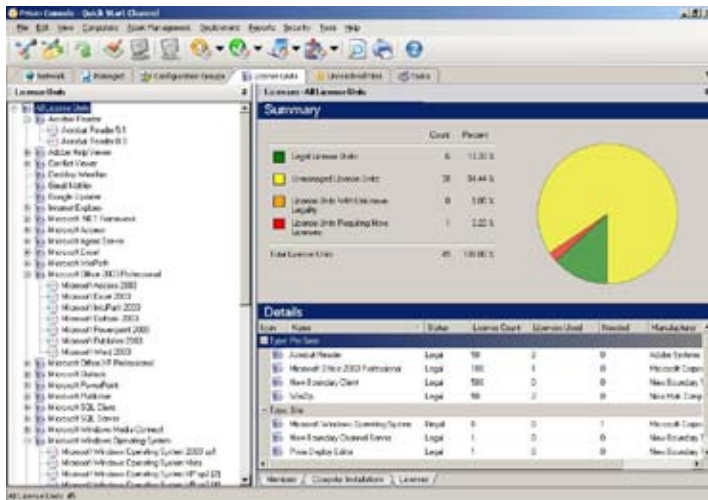

■ **License Management** – Prism Asset Manager accurately identifies all software that is installed in your environment and determines compliance with available licenses, so you can better plan for software procurement and migration as well as software audits.

■ **Dynamic Configuration Management** – By defining configuration groups, administrators can monitor for specific software and hardware changes that require remediation—providing continuous, real-time monitoring of baseline configurations. Dynamic Inventory lets administrators track configuration changes without the need for full network inventory scans, saving time and network bandwidth.

■ **Robust Reporting** – Through the Prism reporting engine, Prism Asset Manager provides standard reports such as inventory scan alerts, installed software summary, installed hardware summary, and also allows you to create customized reports that match your processes and asset information needs.

■ **User-Defined Fields** – Prism Asset Manager supports user-defined fields within the Prism Console. This allows administrators to customize and extend Prism Asset Manager by adding new information fields about computers and applications that have been inventoried.

■ **Prism Console** – Prism Asset Manager is administered through the new Prism Console and delivers all the console's features, including customized views, simplified client installation, computer licensing, and changing polling intervals.

Prism Asset Manager provides summary and detail information views of hardware and software inventory.

■ **64-Bit Support** – Prism Asset Manager fully supports 64-bit hardware and software to deliver comprehensive IT inventory and asset management.

■ **Windows Vista™ Support** – Prism Asset Manager leverages Windows Vista features to simplify IT management. It's the perfect tool to help you prepare for migration to the Windows Vista operating system by identifying workstations that need upgrades and those that meet the requirements for running Windows Vista.
